

Join us to
take part in a
Healthier future!

TEL AVIV SOURASKY
MEDICAL CENTER
ICHILOV

Did you know that our body hosts a thriving community of tiny living creatures?

These organisms, known as the 'microbiome', live inside us and are composed of over 1,000 different kinds of bacteria. They work in cooperation with our body and are vital to our health.

In recent years, many studies have been conducted that examined the relationship between the composition of bacterial populations in the gut and health and disease states in humans, it was found that **by transferring gut bacteria from a healthy person to a sick person, it is possible to improve the person's health!**

Your Contribution Matters:

- Advancing cancer research through convenient & simple stool sample donations
- Development of effective and targeted cancer treatments by understanding the relationship between the microbiome and cancer
- Continue fostering collaboration among researchers, clinicians, and institutions for collective progress in cancer research and patient care.

Make the change today!

* A sample can be provided at the clinic or use an easy-to-use home kit
